# LIFTING MECHANISM USING HYDRAULIC CYLINDERS

Sahil Shinde, Shivraj Sapkal, Siddhesh Gavhane, Chetan Gudadinni  
Pimpri Chinchwad college of engineering, Pune

**Abstract- - The main objective is to design product which will help us to load and unload goods into the goods carrier vehicles, so to reduce the labour work and increase the efficiency we are designing a product using hydraulic mechanism.**

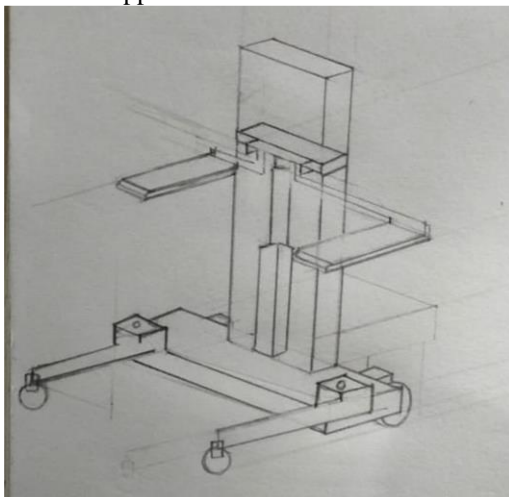

*Keywords*—Hydraulic cylinders, rollers, pillar

## I. INTRODUCTION

We identified that people face many difficulties for loading – unloading and stacking of the goods into the goods carrier vehicles. Most of the stacking work is done by the Laborers. Thus, it results in wastage of time, money and manpower. In our project we want to Design a LIFTING MECHANISM which can transport the goods easily with minimum human efforts.

## II. DESIGN SPECIFICATION

To Fulfill our problem statement various Design were examined and tried to get The best in our design. While designing the portable lifting mechanism almost care was taken regarding the weight its usability, easy operation, so that it can be done by any operator by considering all this parameters we design various components and finally came up with a product, which we think will definitely be useful in industrial application

It is a fully detachable system right from the base, then the hydraulic cylinder holding pillar and the platform for the operator to stand on it are fully detachable.

Even while designing the arms, a unique element was added where slots are provided in both the lifting arms. The slots provided so that a plate can be inserted in the two arms and a proper plane surface can be provided whenever required. Also the two lifting arms slide sideways so that the distance can be adjusted according to the requirement of the load.

## III. COMPONENTS

### • Detachable base

The base is one of the main component as all the mounting are done are done on the base itself. The hydraulic cylinders holding pillar, standing platform for operator are all mounted on the base. The two front wheel arms reach to the surface and don't get blocked by 2 front wheel arms.

### • Hydraulic cylinder holding pillar

The hydraulic cylinder is fixed the pillar, the two lifting arms attached to the plate slide in the pillar and lifts the weight to a particular height. The standing platform is also given support by the pillar

The standing platform is made foldable using small hydraulics and also it is removable. So it does not add up to the total weight of the mechanism. The main function of the standing platform supported by hydraulics is to act as a counter balance for the whole mechanism when the load is lifted to a particular height. The standing platform and the pillar is hold by small hydraulics strengths in this mechanism.

**Dimension:**

Base: 500mm x 950mm

Pillar: 275mm x 1400mm

Standing platform: 400mm x 800mm

**Material:**

Pillar: Load acts on pillar tends to break or cause bending the component. Stainless steel is used on the basis of strength, stiffness, plasticity and hardness.

Hydraulic cylinder: It is subjected to the compressive force which impose buckling and bending of component. Longitudinal and circumferential stress also generated because of internal compressive stress. Hence mild steel is a good option because of high ductility and hardness

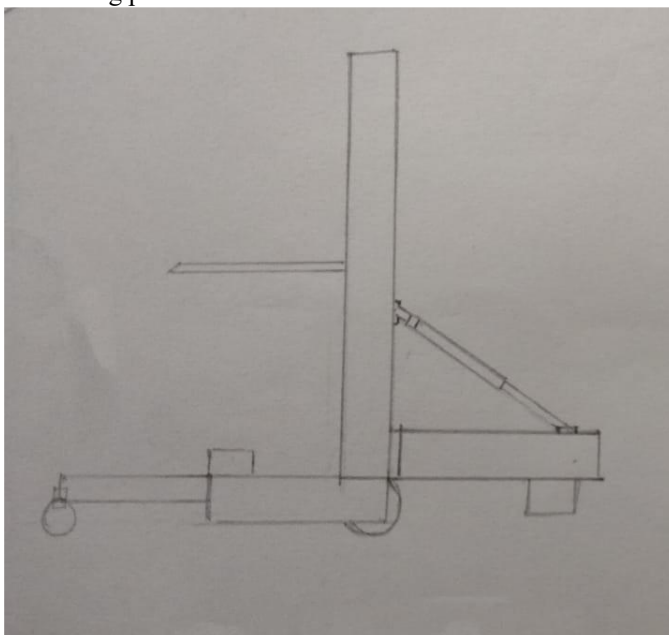

Base platform: Whole assembly stability based on this therefore mechanical properties are needed like strength, hardness etc. so recommended material is mild steel.

**IV. WORKING PRINCIPLE**

Hydraulic lift works on the principle of Pascal Law. The principle of transmission of fluid-pressure or Pascal Law is the principle in fluid mechanics that explain that the pressure applied anywhere in a confined incompressible fluid is transmitted equally in all directions throughout the fluid such that the pressure variations (initial differences) remain the constant. The common logic behind every hydraulic mechanism is very simple that is Force that's applied at one point is transmitted to another point using an incompressible fluid. The force is almost always multiplied in a process. A common hydraulic mechanism consists of two pistons and an oil-filled pipe connecting to them. In single acting cylinder the output force is developed in only one direction when you feed oil or hydraulic fluid into it through the inlet port it will extend exerting force and the piston will move upwards. In this case we are using hydraulic hand pump to provide pressurized fluid, hand pump are easy to use but we could alternatively use an electric pump or air driven pump.

when the work is done you need to release fluid back into the tank. to do this needle valve is fitted into the hand pump, you open the valve the oil flows back into the tank and piston will drop.

● Standing platform for counterbalance

#### V. FUTURE SCOPE:

- The machine can be used for domestic as well as commercial purpose.
- The machine can prove much helpful in industrial zones by lifting heavy metals, various equipment, scraps, etc and loading them to a particular destination.
- A LPG gas cylinder can be lifted or shifted to a desired location without moving the vehicle.

#### VI. CONCLUSION

- The machine will be useful in lifting heavy weights eventually reducing man power to a greater extent.
- Hydraulic system installed provides flexibility to lift greater weight unlike pneumatic system.
- since the base (platform) is detachable it reduce weight of the machine and also helps in moving the weights to a different location using rollers.
- The bracket platform installed at the back of the machine eliminates the use of counter weights used in conventional machines.
- The rollers helps in moving the machine with easy turns and lock for rollers helps the machine to remain stationary

# IJEAST

INTERNATIONAL JOURNAL  
OF ENGINEERING APPLIED SCIENCE  
AND TECHNOLOGY

## ABOUT IJEAST

International Journal of Engineering Applied Science and Technology (IJEAST) is a peer-reviewed, open access journal that publishes high-quality research papers in the field of Engineering, Applied Science and Technology.

IJEAST aims to provide a platform for researchers, academicians, and professionals to share their innovative ideas, research findings, and practical experiences with the global scientific community.

## FOCUS AREAS

- Engineering
- Applied Science
- Technology
- Innovation & Development
- Interdisciplinary Studies

### PEER REVIEWED

All submissions are rigorously peer reviewed to ensure quality.

### OPEN ACCESS

Free and unrestricted access to research for all.

### GLOBAL REACH

Connecting researchers and professionals worldwide.

### TIMELY PUBLICATION

We ensure a swift and efficient publication process.
