Abstract— Health monitoring systems have rapidly evolved recently, and smart systems have been proposed to monitor patient current health conditions, in our proposed and implemented system, we focus on monitoring the patient’s heart rate, and his body temperature. Based on last decade statistics of medical records, death rates due to hypertensive heart disease, shows that the blood pressure is a crucial risk factor for atherosclerosis and ischemic heart diseases; thus, preventive measures should be taken against high heart rate which provide the ability to track, trace and save patient’s life at appropriate time is an essential need for mankind. Nowadays, Globalization demands Smart cities, which involves many attributes and services, such as government services, Intelligent Transportation Systems (ITS), energy, health care, water and waste. This paper proposes system architecture for smart healthcare based on GSM and GPS technologies. The objective of this work is providing an effective application for Real Time Health Monitoring and Tracking. The system will track, trace, monitor patients and facilitate taking care of their health; so efficient medical services could be provided at appropriate time. By using specific sensors, the data will be captured and compared with a configurable threshold via microcontroller which is defined by a specialized doctor who follows the patient; in any case of emergency a short message service (SMS) will be sent to the Doctor’s mobile number along with the measured values through the GSM module. Furthermore, the GPS provides the position information of the monitored person who is under surveillance all the time. Moreover, the paper demonstrates the feasibility of realizing a complete end to end smart health system responding to the important health system design requirements by taking in consideration wider vital human health parameters such as respiration rate, nerves signs etc. The system are going to be ready to bridge the gap between patients - in dramatic health change occasions and health entities who respond and take actions in real time fashion.

I. INTRODUCTION

The system will track, trace, monitor patients and facilitate taking care of their health; so efficient medical services might be provided at the acceptable time. By using specific sensors, the info are going to be captured and compared with a configurable threshold via microcontroller which is defined by a specialized doctor who follows the patient; in any case of emergency a brief message service (SMS) are going to be sent to the Doctor’s mobile number along side the measured values through GSM module. Furthermore, the GPS provides the position information of the monitored one that is under surveillance all the time. Moreover, the paper demonstrates the feasibility of realizing a complete end to end smart health system responding to the important health system design requirements by taking in consideration wider vital human health parameters such as respiration rate, nerves signs etc. The system are going to be ready to bridge the gap between patients - in dramatic health change occasions and health entities who respond and take actions in real time fashion.

II. METHODOLOGY

The patient would place his/her finger on the sensing unit. The sensors would sense the heartbeat and the vitals with body temperature and current location The sensed data rates and location are sent to Arduino Uno in the form of signals. The Arduino processes the same data and would transmit the data to the Wi-Fi module and GSM Module The Wi-Fi module would then retransmit the data to the smartphone application. The GSM Module would then send the message if there is any emergency. The alert message will be shown in the smartphone application if the sensed rate is more than the desired rate.

Keywords— GPS, GSM, ITS, SMS, etc.
III. CONCLUSION
The objective of this work is providing an effective application for Real Time Health Monitoring and Tracking. The system will track, trace, monitor patients' health and facilitate taking care of their health; so efficient medical services could be provided at appropriate times.
